

GX0011322: SAF JET FUEL NWE HEFA PRODUCTION COST MODEL B MAX JET

INDEX DESCRIPTION

These indexes reflect a minimum cost price for sustainable aviation fuel produced in North West Europe via the HEFA pathway. The refinery scenario modelled is "Max Jet". Total renewable product yield is 89% (70% SAF, 14% Bio-Naphtha, 5% Bio-LPG). It assumes a facility in Rotterdam with 820,000 MT/annum total renewable product capacity. Feedstock is 100% Used Cooking Oil (UCO).

INDEX DETAILS

Start date	02-Jun-2023
Commodity	Jet Fuel
Frequency	Daily
CCY / UOM	USD / MT
Precision	2 decimal places
Periods	1, Prompt
Data types	Index
Pricing basis	Flat
Delivery basis	ExWorks
Trading hub	NWE
Timezone	Europe/London
Holiday calendar	Holidays_GX_Europe

INDEX QUALITY SPECIFICATION

HEFA-SPK (Hydrotreated Esters and Fatty Acids-Synthesized Paraffinic Kerosene) meeting the technical certification standard ASTM D7566 set by the American Society for Testing Materials. "Neat" SAF is a drop-in fuel blending component derived from lipid feedstocks such as plant or algae oils, tallow, or waste greases such as cooking oils which are first deoxygenated and then hydroprocessed to produce a pure hydrocarbon.

CRITERIA FOR INCLUSION

Index calculation inputs comprise:

1. Variable Costs:

- Lipid Feedstock (UCO NWE)
- GX Netherlands Grey Hydrogen
- ICE Dutch Power Base Futures
- Class II HVO NWE
- FX EUR:USD

2. Fixed Costs and Assumptions:

- CAPEX, TPEC, Financials and OPEX costs for renewables refinery production in North West Europe
- Model A reflects a facility with 820,000 MT of total annual renewable product output
- Model A Max Jet assumes a total renewable product yield is 89% (70% SAF, 14% Bio-Naphtha, 5% Bio-LPG)

The final cost-based price does not include a margin.
